# Apply filters to SQL queries

## Project description

Effectively filtering through provided tasks with SQL to make the system more secure. I will be investigating security issues, and updating employee computers as needed. The steps below provide examples of how I used SQL to preform security related tasks.

## Retrieve after hours failed login attempts

To query the failed login attempts that occurred after eighteen hundred hours I selected all columns in the `log_in_attempts` and filtered by the login_time as well as used the `>` operator to narrow the results further. This resulted in nineteen failed attempts that occurred after hours.

```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE login_time > '18:00' AND success = FALSE;
+----------+----------+------------+------------+---------+-----------------+---------+
| event_id | username | login_date | login_time | country | ip_address      | success |

## Retrieve login attempts on specific dates

After verifying failed login attempts following up with login attempts from specific date ranges is the next step in verifying the the security protocols in place. After making the query the results were a total of seventy-five attempts between the specified dates.

```

## Retrieve login attempts outside of Mexico

Creating a query to identify all login attempts outside of Mexico after determining that the activity didn't originate in Mexico. The country column contains both `MEX` and `MEXICO` so using the operator `LIKE` with the `%` will produce the appropriate results to this query.

```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE NOT country LIKE 'MEX%';
+----------+----------+------------+------------+---------+-----------------+---------+
| event_id | username | login_date | login_time | country | ip_address      | success |

## Retrieve employees in Marketing

In this task retrieving the information on employees in marketing is the next step. `WHERE` we will be looking is within the `Marketing department` and to do this I'll use the `=` operator. To also search just the `East` building I'll use similar arguments. I'll replace `department` with `office` followed by `LIKE 'East%';`. This will bring up the appropriate search results.

```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'Marketing' AND office LIKE 'East%';

## Retrieve employees in Finance or Sales

The departments outside of IT need different security updates and this query will provide the results needed to accurately assign updates. To do so I'll `SELECT` all columns `FROM` the employees and filter them by using `OR`.

```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'Finance' OR department = 'Sales';
+-------------+--------------+----------+------------+-------------+
| employee_id | device_id    | username | department | office      |
+-------------+--------------+----------+------------+-------------+
|        1003 | d394e816f943 | sgilmore | Finance    | South-153   |
|        1007 | h174i497j413 | wjaffrey | Finance    | North-406   |
|        1008 | i858j583k571 | abernard | Finance    | South-170   |
|        1009 | NULL         | lrodriqu | Sales      | South-134   |

```

## Retrieve all employees not in IT

IT department has already received updates and now all that is left is to check the other departments to see who needs the update. To do this the `NOT` operator will be used after `WHERE` and the corresponding arguments will be used to query. The `=` is used to specify which department to exclude.

```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE NOT department = 'Information Technology';
+-------------+-------------+----------+-----------------+-------------+
| employee_id | device_id   | username | department      | office      |
+-------------+-------------+----------+-----------------+-------------+
|        1000 | a320b137c219 | elarson  | Marketing       | East-170    |
|        1001 | b239c825d303 | bmoreno  | Marketing       | Central-276 |
|        1002 | c116d593e558 | tshah    | Human Resources | North-434   |
|        1003 | d394e816f943 | sgilmore | Finance         | South-153   |
|        1004 | e218f877g788 | eraab    | Human Resources | South-127   |
|        1005 | f551g340h864 | gesparza | Human Resources | South-366   |
|        1007 | h174i497j413 | wjaffrey | Finance         | North-406   |
|        1008 | i858j583k571 | abernard | Finance         | South-170   |
|        1009 | NULL         | lrodriqu | Sales           | South-134   |
|        1010 | k2421212m542 | jlansky  | Finance         | South-109   |
|        1011 | l748m120n401 | drosas   | Sales           | South-292   |
|        1015 | p611q262r945 | jsoto    | Finance         | North-271   |
```

## Summary

This project was an example of using various SQL commands to filter through different inquiries. I applied filters to get specific information on login attempts and employee machines. I used two different tables, `log_in_attempts` and `employees`. I used the `AND`, `OR`, and `NOT` operators to filter for specific information needed for each task. I also used `LIKE` and the percentage sign `(%)` wildcard to filter for patterns throught the query.
